

HHS gave healthcare orgs an extra year on video accessibility.

The WCAG deadline moved to May 2027. An extra year is exactly enough time to build the pipeline.

THIS WEEK

A 60 minute recording became five captioned vertical clips.

The audio never left my laptop.

New cost. Zero.

STEP ONE

saywhat

Timestamped transcript of any video, locally, with whisper. Skim the hour in five minutes and find the 40 second moments worth keeping.

```
$ python3 saywhat.py recording.mp4 --timestamps
```

STEP TWO

cutshort

Cuts those moments into vertical shorts with captions burned in. Word level timing. Title cards. One JSON file describes the whole batch.

```
$ python3 cutshort.py build spec.json --out  
short.mp4
```

THE PART THAT MATTERS IN HEALTHCARE

A cloud vendor that touches a patient's voice becomes a business associate.

That means a BAA before the first byte goes up.

Local processing makes the whole question go away.

BY THE WAY

Captions are the floor.

WCAG puts captions on prerecorded video at Level A.

The AA deadline everyone is tracking assumes you already did this part.

What does your team do today with a recording that might have a patient's voice on it?
