

**Seven tools.
All free.
All started as code I
was already running
for paying work.**

One per slide. What it does, what it saved me, the one command that runs it.

All MIT. No signup, no hosting, no pricing page.
You download a file and you run it.

VIDEO

saywhat

Transcript of any video link, on your own machine. Whisper runs locally. No API key.

What it saved me. Skimming an hour of video in five minutes.

```
$ python3 saywhat.py "youtu.be/xyz" --timestamps  
# [00:00] So the first thing I did was...  
# [00:14] ...and that broke everything, which
```

VIDEO

cutshort

Cuts a long video into vertical shorts with captions burned in. Word level timing. Title cards.

What it saved me. An editor day. One JSON file describes the whole batch.

```
$ python3 cutshort.py cut talk.mp4 --start 1:54  
--end 2:03  
$ python3 cutshort.py build spec.json --out  
short.mp4
```

VIDEO

tapewarp

Makes any video look like a 90s camcorder shot it. Scanline drift, tracking errors, color bleed. Not an overlay.

What it saved me. A paid app. 300 lines of Python. My son wrote the spec.

```
$ python tapewarp.py clip.mov --wear worn  
# rented twice a week since 1992 (default)  
$ python tapewarp.py clip.mov --wear trashed  
# found in a flooded basement
```

MOBILE

localflight

Builds your Expo iOS app on your own Mac and pushes it to TestFlight.

What it saved me. Cloud build minutes I was paying for. My laptop does the build in four.

```
$ ./localflight.sh --dry-run  
# shows every detected value and command, runs  
nothing  
$ ./localflight.sh --bump  
# bumps the build number, builds, submits
```

ruby_sage

A Rails gem. Ask your codebase how billing works and get an answer with file citations.

What it saved me. The day the person who knows the billing flow leaves.

```
# Gemfile
gem "ruby_sage"
$ rails generate ruby_sage:install
$ bundle exec rake ruby_sage:scan
```

AGENTS

permissioned-mcp-server

Every tool the agent can call has a scope. Unauthorized tools don't show up in the list, and get rejected again at execution.

What it saved me. Handing an agent the keys to everything. Same idea as a read only database user.

```
$ MCP_SCOPES=notes:read npm start  
# notes:admin never appears in tools/list  
# deletes need an id-bound confirmation
```

EVALS

agent-eval-harness

Write down what the agent should do on a set of inputs. Change the prompt. Run it. See what moved. Fails CI when behavior regresses.

What it saved me. Finding out from a customer on Friday. If I could only keep one it's this one.

```
$ agent-eval run --config suite.json \  
  --cases cases.jsonl --output latest.json  
# exact match, required phrase, JSON graders  
# plus an LLM judge you plug in yourself
```
