

I run AI agents that draft my company's marketing every day.

Nothing they write goes out until I tap approve on my phone.

That one gate is why the whole thing works.

Generate freely. Approve on the way out.

THE MORNING

Agents research, write and queue. I get a stack of drafts.

Approve.

Dismiss.

Or send it back with one line of feedback.

Ten minutes and I'm done.

WHY THE GATE

A prompt tweak can make the drafts a little dumber and nobody notices for two days.

With the gate, that's two days of dismissing drafts.

Without the gate, that's two days of posts with my name on them.

THREE THINGS THAT MATTERED MORE THAN THE MODEL

The gate. A person says yes before anything leaves.

Tools over prompts. The agent calls a tool to schedule a post instead of me describing the schedule inside a prompt.

An eval that runs when I change the prompt. So I find out on Tuesday, not on Friday.

Where in your process would that one tap go?

13 years of Rails taught me to build things that don't break without telling you. Turns out that's most of what production AI means.
